

Continue to Spring MVC n Hibernate Integration.

1. Continue with the same project.

(All the dependency JARS for spring n hibernate are already added in pom.xml)

2. Copy database.properties n hibernate-persistence.xml from
day13-data\day13_help\spring-hibernate-templates folder under <src>/<main>/<resources> i.e under the
runtime class path.

3. Edit database.properties , as per your DB settings

4. Uncomment import statement from spring-servlet.xml (i.e import hibernate-persistence.xml from
spring-servlet.xml)

5. Either create POJO from database table , or generate tables from POJO.

6. Build the layers , in the bottoms up manner.

(refer : day13-data\day13_help\diags\comparioson of layers JSP-JB vs Spring MVC.png)

Controller---Service--DAO --POJO--DB.

7. POJO layer no change . (Meaning @Entity + @Id annotated pojoes for entities n @Embeddable
annotated pojoes for value types)

8. Create DAO layer i/f , as usual.

9. In DAO imple class

class level annotation --- @Repository

Dependency : org.hibernate.SessionFactory --- @AutoWired

9.1 CRUD methods

Typically : get session from SF (getCurrentSession) --invoke session API

(save/persist...../createQuery...) n return results to the caller.

10. Service layer i/f : add B.L method declarations

Service layer implemetation class

class level annotation --- @Service , @Transactional

Dependency : DAO layer i/f --- @AutoWired

11. Controller layer (req handling controller)

class level annotation --- @Controller : mandatory

optional class level annotation for the separation : @RequestMapping

Dependency : Service layer i/f --- @AutoWired

11.1 Controller class contains : req handling methods (to be invoked by D.S)

Mandatory method level annotation : @RequestMapping | @GetMapping | @PostMapping.....
