

Regarding logging framework in Java : project objective

Spring Boot being highly opinionated framework , it has it's own mindset.
It allows us to forget about the majority of the configuration settings, many of which it auto-configures.

It understands the need of logging , in a typical web application.

In the case of logging, we don't have to explicitly import it's starter , since a starter, like our spring-boot-starter-web, depends on spring-boot-starter-logging, which automatically pulls in JCL (Jakarta Commons Logging API)

Simple Logging framework(facade) in Java : SLF4J

There are different logging levels , in asc order of severity
trace , debug , info , warn , error
Default logging level in spring boot app : info
Meaning : spring boot app will auto display : info , warn , error

How to add logging in controller /service classes ?

Add one field :

```
org.slf4j.Logger logger = LoggerFactory.getLogger(LoggingController.class);
```

OR simply use Lombok annotation

@Slf4j : at the class level -- It will auto inject a Logger in the field : log

eg :

```
@RestController
```

```
@Slf4j
```

```
public class LoggingController {
```

```
    @RequestMapping("/")
```

```
    public String index() {
```

```
//it's in asc manner of severity : logging levels
```

```
    log.trace("A TRACE Message");
```

```
    log.debug("A DEBUG Message");
```

```
    log.info("An INFO Message");
```

```
    log.warn("A WARN Message");
```

```
    log.error("An ERROR Message");
```

```
    return "Testing logging here....";
```

```
    }
```

```
}
```

Note :

Default setting in application.properties file :

```
logging.level.root=info
```

To change it to error (in deployment phase)

```
logging.level.root=error
```

To enable logging of debugging message , for a particular module/package :

eg : debug=true

```
logging.level.org.springframework.orm.hibernate5=debug
```

```
logging.level.com.app.service=debug
```

After complete testing of the project, to suppress , info , debug messages , set :

logging.level.root=error
