

1. Regarding Swagger :

Standard testing n documentation tool for REST APIs : OAS (Open API specification n Swagger)

OpenAPI Specification (OAS):

The OAS, is an open standard(spec) for describing and documenting n testing RESTful APIs.

It provides a machine-readable representation of an API, allowing developers to understand its endpoints, request/response data formats(payloads) , authentication methods etc..

The specification is written in YAML(Yet Another Markup Language) or JSON format and serves as a contract between the API provider(REST server) n it's consumer(REST clnt)

It is widely used in the industry to build, test, and consume APIs, supplying better communication and collaboration between development teams.

Swagger:

Swagger is a collection of open-source tools(eg. swagger-ui) that support this specification and provide additional functionalities like API documentation and code generation.

Swagger is an open-source set of tools built around the OpenAPI Specification.

How to use ?

1.1 Add swagger dependency in pom.xml

(Already added in spring boot backend template project)

```
<!-- Swagger UI -->
```

```
<dependency>
  <groupId>org.springdoc</groupId>
  <artifactId>springdoc-openapi-ui</artifactId>
  <version>1.7.0</version>
</dependency>
```

1.2 From web browser , access swagger endpoint

<http://localhost:8080/swagger-ui/index.html>
