

What is pagination ?

Dividing larger no of results (eg : products , users, reviews , blogs ...) into fixed size pages/slices.

How will you add it's support ?

Steps

The Dao i/fs extends from JpaRepository ----> PagingAndSortingRepository --> CrudRepository --> Repository

PagingAndSortingRepository Methods

package : org.springframework.data.repository

1.

Page<T> findAll(Pageable pageable)

Returns a Page of entities meeting the paging restriction provided in the Pageable object.

i/p : Pageable : i/f for pagination

Implementation class : PageRequest

2. Method of PageRequest class

public static PageRequest of(int pageNumber,int pageSize)

Creates a new unsorted PageRequest.

Parameters:

pageNumber - zero-based page number

pageSize - the size of the page to be returned(>0)

3. Page<T> : i/f

It's inherited method for Slice<T>

List<T> getContent()

Returns the page content as List.

T : type of the entity

eg :

```
Pageable pageable = PageRequest.of(pageNumber, pageSize);
```

```
// fetch the Page of Entity --> getContent() --> List<Entity>
```

```
List<Entity> empList = empDao.
```

```
    findAll(pageable).getContent();
```
