

1. Continue with Spring Boot Testing

Refer - "day14-data\day14_help\Advanced REST\Advanced REST\readmes\Regarding Spring Boot Testing.txt"

1.1 Write integration test (service layer test) for assigning user address.

Project - blogs_api

AddressServiceTest.java

1.2 Refer to end to end integration test (after understanding RestTemplate)

RestControllerTestWithServer.java

2. Inheritance in JPA / Hibernate

Refer - "day15_help\hibernate_inheritance\regarding hibernate inheritance.txt"

3. What is pagination ?

Dividing larger no of results (eg : products , users, reviews , blogs ...) into fixed size pages/slices.

How will you add it's support ?

Steps

The Dao i/fs extends from JpaRepository ----> PagingAndSortingRepository --> CrudRepository --> Repository

PagingAndSortingRepository Methods

package : org.springframework.data.repository

1.

Page<T> findAll(Pageable pageable)

Returns a Page of entities meeting the paging restriction provided in the Pageable object.

i/p : Pageable : i/f for pagination

Implementation class : PageRequest

2. Method of PageRequest class

public static PageRequest of(int pageNumber, int pageSize)

Creates a new unsorted PageRequest.

Parameters:

pageNumber - zero-based page number

pageSize - the size of the page to be returned(>0)

3. Page<T> : i/f

It's inherited method for Slice<T>

List<T> getContent()

Returns the page content as List.

T : type of the entity

Ready example - EmployeeController in project - spring_boot_ems_backend_final

Later Solve - Paginate blog posts

eg - 1. Pageable pageable = PageRequest.of(pageNumber, pageSize);

2. To fetch the Page of blogs , use Pageable's getContent() , to get a List<BlogPost>

List<BlogPost> list = postRepo.findAll(pageable).getContent();

4. Image Handling

5. Spring boot internals

6. Full Stack Demo

7. thymeleaf

7. Spring security
