

1. `${sessionScope.team_dtls}`
`sessionScope.get("team_dtls")` --> to string --> sent to clnt
OR
`session.getAttribute("team_dtls")` --> to string --> sent to clnt

2. Suppose you have added offer(sale) info under the app scope

How ?

```
<%  
    application.setAttribute("sale_info",new Sale(...));  
%>
```

Equivalent servlet code

```
doGet(rq,rs) ....  
{  
    getServletContext().setAttribute("sale_info",new Sale(...));  
}
```

How to display sale info to the clnts, in JSP using EL syntax ?

`${applicationScope.sale_info}`

WC : `getServletContext().getAttribute("sale_info").toString()` --sent to clnt

`${sale_info}` : WC searches under `pageScope` --> `requestScope`--> `sessionScope` --> `applicationScope`

--result sent to clnt

Works BUT slower

Suppose you have added a `page scoped attribute` , how ?

eg : one.jsp

```
<%  
    pageContext.setAttribute(nm,val);  
%>
```

How to display ?

`${pageContext.nm}`

`${pageScope.nm}`

`${page.nm}`

`${nm}`

Options : 2 , 4
